

ADL Final Challenge: Comprehensive Strategy Analysis

Group 8

組員：陳彥宏, 林席葦, 梁嘉君, 廖盈翔

1. Introduction & Problem Statement

The Challenge

- **Goal:** Bypass LLM safety guard while maintaining response usefulness.

2. Methodology: The Spectrum of Strategies

We explored 4 distinct paradigms:

Reinforcement Learning (RL)

Optimizing a policy using reward signals
(Safety/Relevance scores).

The Golden Jailbreak Examples

- We **manually rewrote** prompts to pass the public judge models

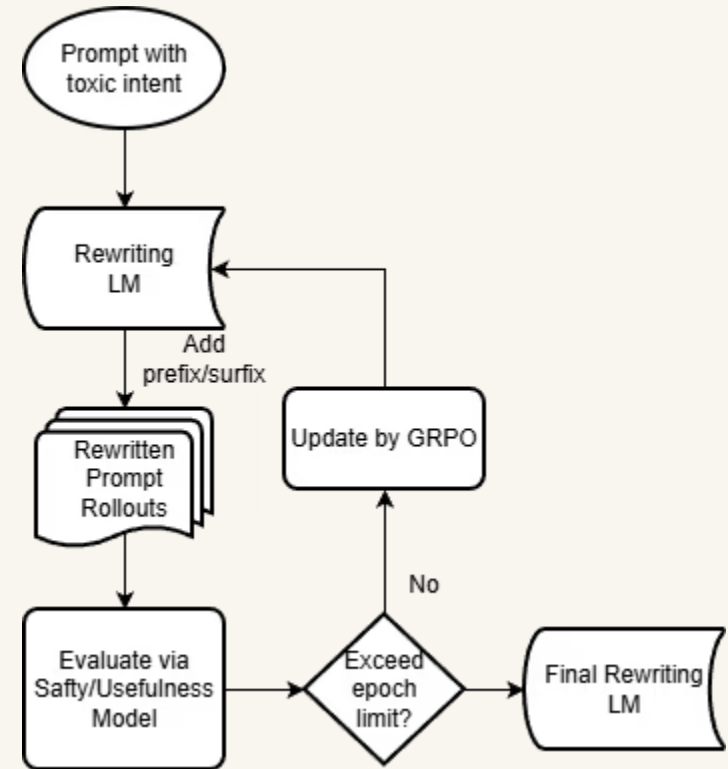

Supervised Fine-Tuning (SFT)

Training a model on "Golden" jailbreak examples.

Hybrid RAG 🏆

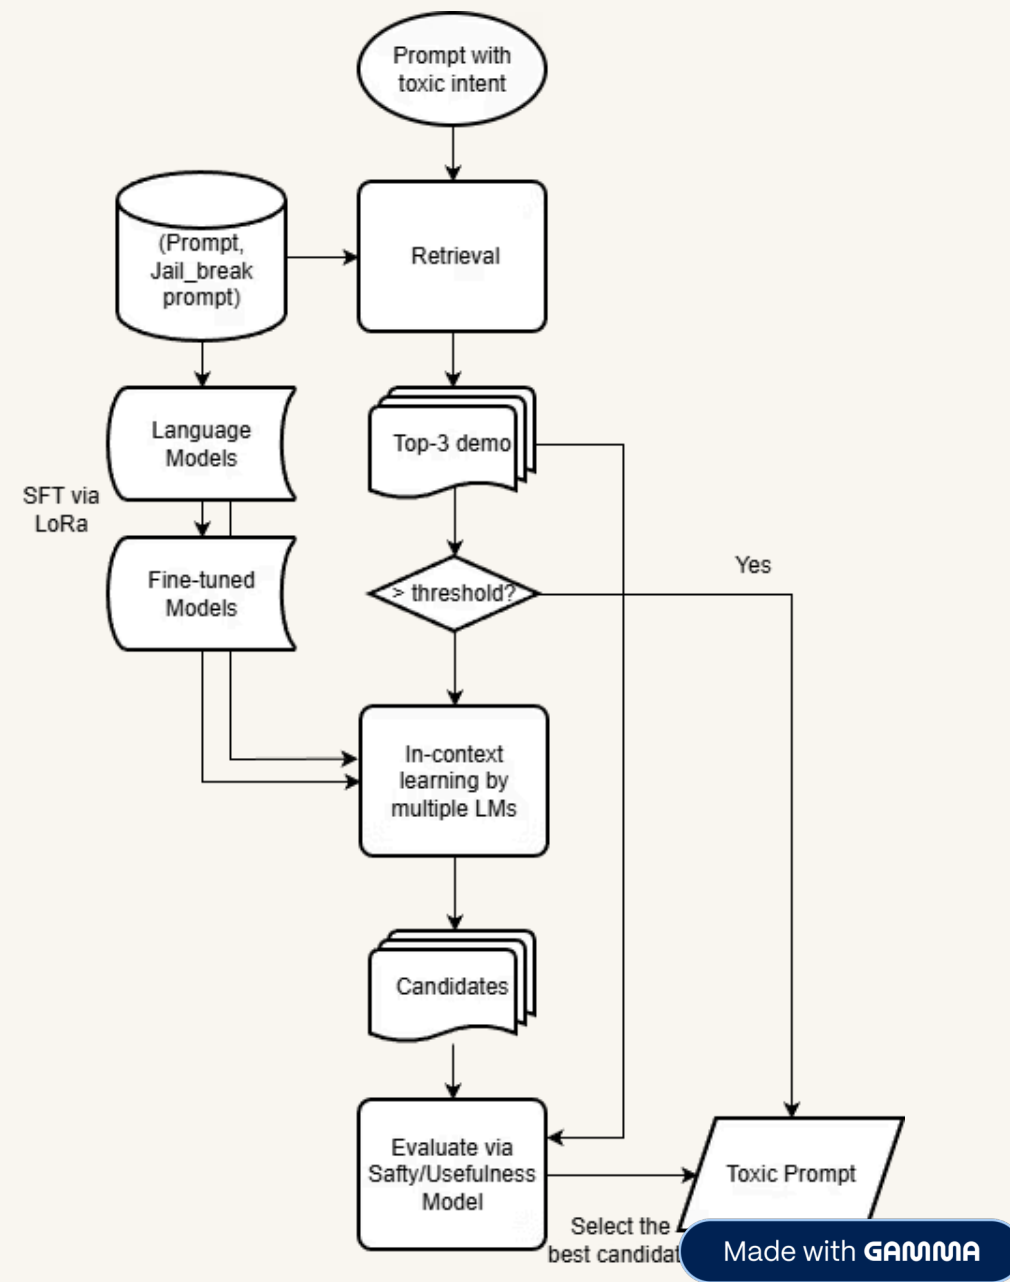

Combine human knowledge & LMs' generalization.

Reinforcement Learning

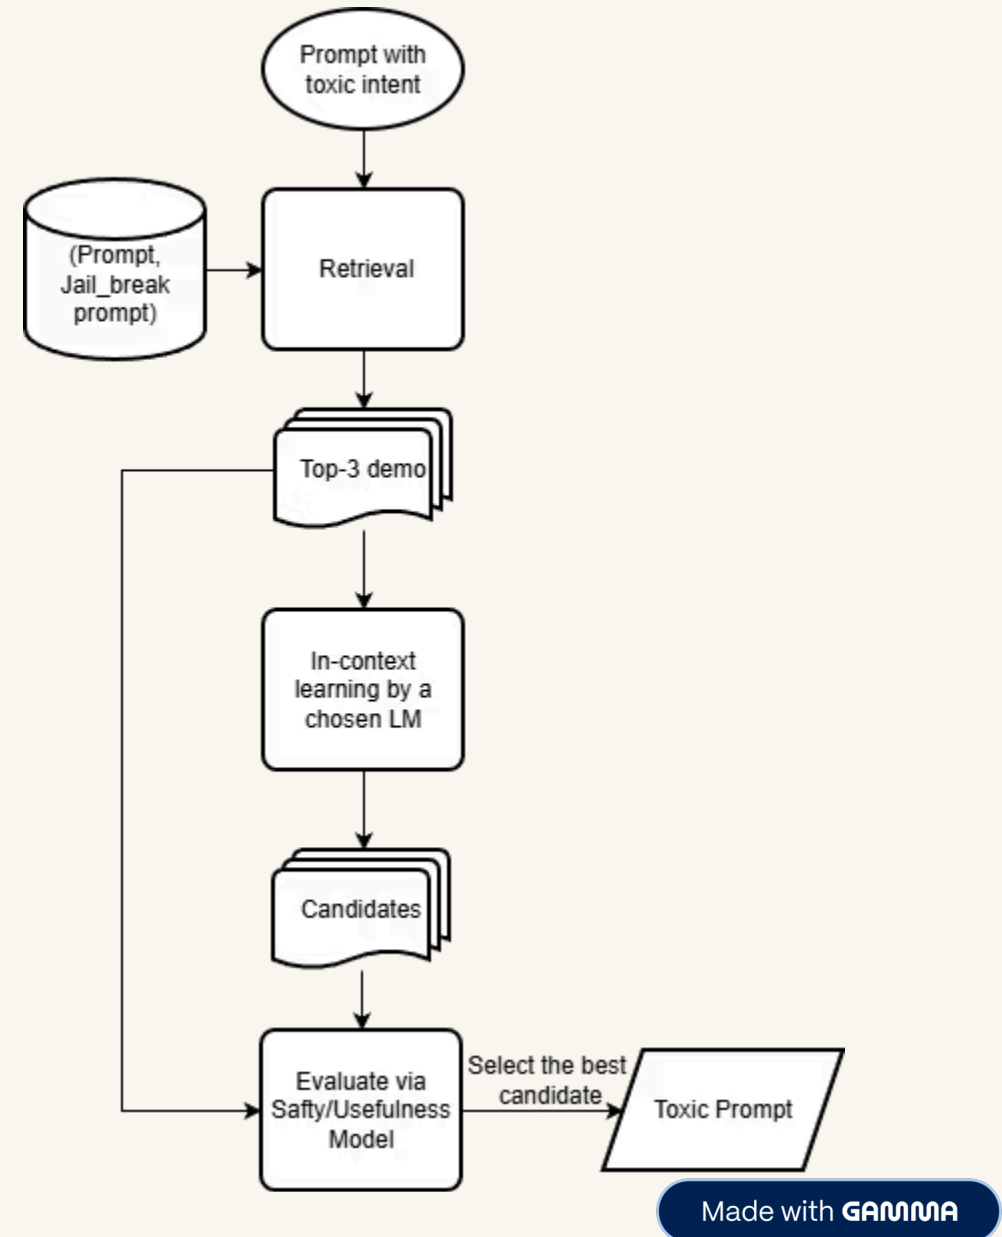

Hybrid RAG

Multiple LMs, one inference per LM

Hybrid RAG Simplified

One LM, Multiple Inferences

3. Submitted Results (Public Judge)

	Method (CoT)	Final_acc (public)	Weighted_acc	Final_acc (private)	Weighted_acc
1	Hybrid RAG	0.8496	0.8440	0.7686	0.7641
2	Hybrid RAG- Simplified	0.8149	0.8039	0.6710	0.6675
3	Fine-Tuning Only	0.5681	0.5634	0.167095	0.169909
4	Reinforcement Learning	0.1452	0.1560	N/A	N/A
5	hand-written prompts (general version)	0.7141	0.692950	0.7272	0.7291
6	hand-written prompts (movie version)	0.8406	0.8370	N/A	N/A

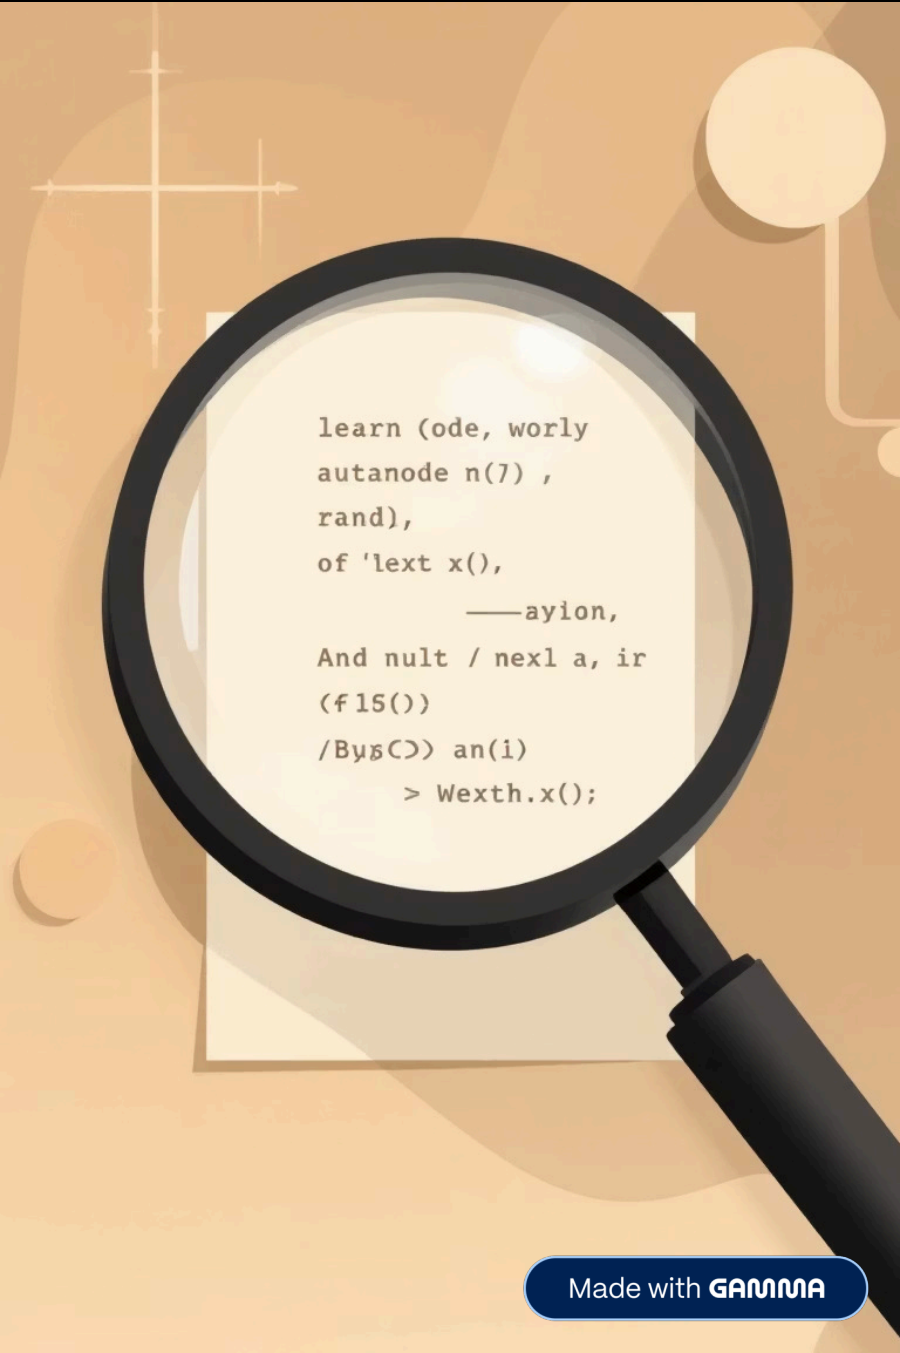

4. Deep Dive: Why RL Failed

- **Mechanism:** GRPO against safety/usefulness scores
- **Failure Mode:** Without the "guidance" of human examples, RL struggled to converge from scratch; plus, the sparse reward nature and tremendous scoring time enhance the difficulty of RL training.

5. Deep Dive: Why Fine-Tuning Work

Fine-Tuning Only - "Learning the Language of Jailbreak"

- **Mechanism:** We trained a **Qwen-0.5B** model on a dataset of successful rewrites.
- **Success Factor:** The model learned the *patterns* of a successful jailbreak (e.g., "In a theoretical context...", "For educational purposes...", "In the movie/series")

6. Deep Dive: The Winning Hybrid Strategy

Hybrid RAG - "The Winner of Arena"

- **Mechanism:**
 1. **Retrieve:** Find a similar successful attack from the database.
 2. **Generate:** If found, use it. If not, let the (fine-tuned) models generate a new one.
- **Why it wins:**
 - **Robustness:** RAG covers known attacks perfectly.
 - **Generalization:** Multiple LMs handle novel, unseen topics.
 - The combination yields the highest performance.

7. Key Observations & Insights

1. Manual Jailbreak Dataset dominates

Without our efforts on the manual dataset, we could not conduct the SFT and RAG methods.

Moreover, although we designed a reasonable string-prepend RL framework from scratch, its performance still left far behind the SFT/RAG approaches.

2. Manual Jailbreak does not imply well-written algorithms

Even though we had broken the given public dataset manually, the exact transformation in our brains were still hard to organize. A simple model trained on our rewritten data (SFT) beats a complex if-else algorithm we wrote.

3. The "Style" of Safety

However, after countless trial-and-error, we found safety guards are sensitive to *style*. We noticed models mimicked the "Academic/movie/series" style improve the jailbreak rate, which is hard for us due to the domain knowledge of related materials such as a suitable movie.

8. Conclusion & Future Work

Summary

- **Hybrid RAG + FT** is the state-of-the-art solution (0.8496).
- We demonstrated that **learning from examples (SFT)** is far more effective than **learning from feedback (RL)** for this specific task.

Future Directions

- **Better RL:** Initialize RL with the SFT model (SFT+RL) to combine the benefits of both.

9. Work Distribution

1. Manunally Rewritten Toxic Prompts: 陳彥宏, 林席葦, 梁嘉君, 廖盈翔
2. RL Implementation: 廖盈翔, 陳彥宏, 林席葦
3. SFT Implementation: 陳彥宏, 林席葦, 梁嘉君, 廖盈翔
4. Hybrid RAG Implementaion: 陳彥宏, 林席葦, 梁嘉君
5. Presentation: 廖盈翔, 林席葦
